

Here's the full arc — what each phase is and what it produced.

Phase 1 — Discovery The system asked you one ignition question and you answered it honestly. That answer became the raw material for everything that followed — user, problem, and the shape of the solution.

Phase 2 — Research You became both the researcher and the subject. Self-disclosure in place of formal interviews produced the Empathy Map, the JTBD framework, and the Competitive Analysis — artifacts grounded in real cognitive experience rather than assumption.

Phase 3 — Strategy The big-picture layer. Vision Statement, Brand Promise, OKRs, and Personas were defined, stress-tested, and locked. This phase established what PMD is for, who it serves, and how success gets measured.

Phase 4 — Roadmap Scope was sequenced. The Now / Next / Later Roadmap named the three horizons and made the first hard call: ship a live URL before anything else. Sequence became a conscious product decision, not a default.

Phase 5 — PRD Requirements were defined, prioritized, and documented with a deliberate tradeoff. Professional tooling was deferred in service of shipping P0 under constraint. The tradeoff section — what you chose not to build and why — became the strongest signal in the document.

Phase 6 — Design & Wireframing Four iterations produced a locked design system: color tokens, typography, zone-by-zone implementation spec, and a full asset inventory. The visual language was settled before a single line of code was written.

Phase 7 — Build Six sessions. Five zones. HTML, CSS, and responsive breakpoints — all deployed to a live URL. The system proved it could close the gap from PRD to shipped product.

Phase 8 — Launch & Marketing This is where the live product gets in front of the right people. It covers launch communications, sharing strategy, and the marketing layer that makes the portfolio credible to hiring evaluators — not just functional.

Phase 9 — Measure & Iterate The post-launch loop. Analytics are read, interpreted, and acted on. What's working gets reinforced. What isn't gets revised. The portfolio stops being a finished artifact and becomes a living product.
